FROM DEVELOPER TO CEO

The Perfect Blend of Technology and Business

SECP1513 · Industry Talk 1 · 26 Oct 2026 · 2–4 PM · Cisco Webex

Executive Summary

A working product is only the beginning. Lasting value comes from solving customer problems, managing operating costs and providing reliable service. MyREDS shows how technical decisions become business responsibilities.

Introduction

Assoc. Prof. Dr. Hj. Mohamad Hafis Izran bin Ishak, CEO of AR Mechatronics PLT, explored the shift from developing software to sustaining a technology business, combining technical ability with business and people skills.

MyREDS visitor journey

Resident Easy Decision System

TIS: People · Hardware · Software · Data · Processes

Technology working as a system

People make decisions; software and hardware execute them. Data and clear processes keep the visitor journey traceable and accountable.

Four key lessons

01 CUSTOMER VALUE
Users and buyers may differ. Understand the real problem, the decision maker and the value each expects.

02 A USEFUL FIRST RELEASE
Build a minimum viable product (MVP) around one complete workflow. Improve it through real user feedback.

03 LIFE AFTER LAUNCH
Hosting, integration, training and support carry costs. Reliability and trust are part of the product.

04 HUMAN ACCOUNTABILITY
Communicate priorities and coordinate people. Validate AI-assisted outputs before relying on them.

Reflection

The webinar broadened our view of software development from building features to delivering reliable value. MyREDS connects residents, visitors, guards and management in a single workflow, so technical choices also affect daily use and trust. A useful MVP should therefore do a real task and improve through user feedback. The difference between users and buyers also demonstrates why developers need to understand both practical needs and the value expected by decision makers.

In future ICT projects we would identify these needs, pilot a complete workflow and plan for hosting, training and support from the beginning. Launch is the start of an ongoing service commitment. The discussion around AI and leadership underscores that we still need humans to be accountable for checking outputs, communicating priorities, and coordinating people. By combining these habits with technical skills, we can help build systems that are useful, reliable, and sustainable.
